

Week 5 troubleshooting

What they see	Cause	Fix
connection refused	server not running	<code>go run ./cmd/server</code> in <code>backend/</code>
<code>bind: address already in use</code>	old process on 8080	<code>lsof -i :8080 / kill</code> ; or temporary other port
cannot find package <code>gin</code>	no get / wrong dir	<code>cd backend && go get github.com/gin-gonic/gin && go mod tidy</code>
404 on <code>/health</code>	path typo / old binary	check <code>r.GET("/health"...)</code> ; restart server
Postman red	<code>https://</code> or wrong host	use <code>http://localhost:8080/health</code>
empty JSON / HTML error	panic / wrong handler	read terminal stack; <code>gofmt</code> ; fix and rerun
WSL: Postman on Windows fails	rare networking	try <code>localhost</code> vs <code>127.0.0.1</code> ; ensure listen <code>:8080</code>
<code>go.mod</code> conflict	module path drift	keep <code>student-management-system</code>

Reset health handler

```
r.GET("/health", func(c *gin.Context) {
    c.JSON(http.StatusOK, gin.H{
        "status": "ok",
        "message": "Backend is running",
    })
})
```

Do not paste the full finished course repo (auth, DB, CORS). Week 5 is health + hello only.
