

Homework — Week 4, Day 1

Due: **before the next session** (date ____).

Submit a **GitHub pull request** (not a zip, not WhatsApp photos).

Deliverable

SMS backend skeleton:

```
backend/  
  go.mod  
  .gitignore  
  .env.example  
  README.md  
  cmd/server/main.go  
  internal/config/.gitkeep  
  internal/handlers/.gitkeep  
  internal/repository/.gitkeep  
  internal/models/.gitkeep  
  internal/routes/.gitkeep  
  internal/middleware/.gitkeep  
  internal/database/.gitkeep  
  internal/utils/.gitkeep
```

Requirements

1. `go.mod` module path: `student-management-system` (or your fork's consistent module path — tell me in the PR if different).
2. `go run ./cmd/server` prints exactly: `sms starting`
3. README includes:
4. three sentences on what SMS is
5. Go version
6. how to run the server command above
7. `.gitignore` includes `.env` and common binaries
8. `.env.example` has placeholder keys only (`PORT` , `DATABASE_URL` , `JWT_SECRET`) — empty values OK
9. `gofmt` clean
10. **No** Gin, **no** HTTP handlers, **no** real secrets

PR checklist

Check	Pass
Branch + PR URL sent	
Tree matches layout	
<code>sms</code> starting works	
README usable by a classmate	
<code>.env</code> not in the PR	
No third-party deps required	

Optional (bonus)

One short PR paragraph: why `internal/` exists in Go, in your own words.

Instructor merges only if `gofmt` is clean and `.env` is not committed.
