

Pointers, memory, repository layer

Move the student map out of handlers into StudentRepository. No Postgres. No JWT.

Outcomes

- Use & and *; explain a nil pointer panic.
- Know why handlers use pointer receivers.
- Call a repository from handlers — HTTP does not own the map.

Shape

```
repo := repository.NewStudentRepository()
h := handlers.NewStudentHandler(repo)
r.POST("/api/students", h.Create)
```

Lab gate

- Nil crash fixed
- Repo owns map; handler has no map fields
- Create + list + get still work; health green

Homework

PR the extract. Include a memory diagram (notebook photo is fine).
