

Instructor checklist — Week 2, Day 1

Pack / prepare the night before

- [] Slides open locally (docs/slides/week-02-day-01.html) — do not depend on GitHub in the room
- [] HDMI / dongle, presenter remote, markers, board
- [] Printed worksheet + lab sheet (one each per student)
- [] Your own ~/epic-go/week02 already working: zeros.go , greet.go , names with green go test
- [] Week 1 leftover list: who still had no GitHub / wrong go version
- [] Student URL sheet below (or a Google Form)

On the board (leave up all day)

```

Declare:  var name type = value
          name := value           (inside func only)
          name = value           (already exists)

Zero:     int 0    string ""    bool false    pointer nil

Convert:  float64(year)    not    year + 0.5

len       = bytes
runes     = utf8.RuneCountInString
    
```

During lab

Walk the room. Pair done students with stuck students. Typical: := at package level, missing * on flags, go test without go.mod , arguing about len("café") .

Pace valve: skip bitwise live typing if conversions ran long. Never skip zero values or the red → green test.

Collect before they leave

#	Student name	GitHub URL (week02 visible)	Worksheet	go test OK
1				

#	Student name	GitHub URL (week02 visible)	Worksheet	go test OK
2				
3				
4				
5				
6				
7				
8				
9

11				
12				
13				
14				
15				

After class

- [] Message the batch: homework due date + link to `homework.md` (10 exercises + `TrimSpace` tests)
- [] Spot-check 3 repos: `gofmt` clean, `go test` green, no binaries committed
- [] Note who still cannot run `go test` for the first 10 minutes of week 3
